Recruitment Site Webinar - September 14, 2016

1. KPMP Overview– Rob Star
2. KPMP Structure – Chris Ketchum
3. Recruitment Site Specifics – Mike Flessner
4. Questions – KUH Staff

Please visit the KPMP website for full details and FAQs
https://www.niddk.nih.gov/research-funding/research-programs/Pages/kidneyprecisionmedicine.aspx
Or Google “NIDDK Kidney Precision Medicine Project”
Goals

- **Understand** human kidney disease
- Ethically **obtain** and **evaluate** human kidney biopsies from participants with AKI or CKD
- Find disease **subgroups** to **stratify** patients
- Find disease **pathways** in key **cells**
- Devise **individualized treatments**
- Improve scientific **knowledge** base
- Improve **pipeline**
Summary of Process

Obtain research kidney biopsy

Interrogate biopsy using visualization/omics/etc.

Curate and visualize data

Create Kidney Tissue Atlas

– Phenotype critical compartments with ~40 RNA-protein-lipid-epigenetic markers
– Identify cell, cell fate (healthy, injured, repair), activated pathways
– Determine diagnosis, sub-group, prognosis

Ensure quality at every step
The NIDDK Kidney Precision Medicine Project aims to ethically obtain and evaluate human kidney biopsies from participants with AKI or CKD, create a kidney tissue atlas, define disease subgroups, and identify critical cells, pathways, and targets for novel therapies. It will have three distinct, but highly interactive activities.

**Recruitment Sites (RS)**
- **RFA-16-026**
  - UG3/UH3 = 12 pages
  - About 4 awards to recruit either AKI or CKD patients for longitudinal cohort studies with research kidney biopsies
  - 2 year UG3 phase to establish common protocols and enroll small numbers of patients
  - 3 year UH3 phase to expand longitudinal cohort studies in initial AKI or CKD populations

**Tissue Interrogation Sites (TIS)**
- **RFA-16-027**
  - UG3/UH3 = 12 pages
  - About 5 awards to support agnostic discovery on human kidney tissue
  - 2 year UG3 phase to use or adapt current “state-of-the-art” methods to interrogate existing samples and small numbers of biopsies; to develop and optimize “next generation” tissue interrogation methods
  - 3 year UH3 phase to implement next generation methods

**Central Hub (CH)**
- **RFA-16-028**
  - Multicomponent U2C (Overall = 6 pages; DCC = 12 pages; DVC = 12 pages; AC = 6 pages)

**Data and sample Coordinating Center (DCC)**
- Support clinical protocol development and statistical calculations
- Perform standard clinical assessments (e.g., patient data reports, recruitment tables)
- Collect, curate, aggregate, store, distribute, and ensure quality control of all data and samples

**Data Visualization Center (DVC)**
- Perform digital pathology
- Create a kidney tissue atlas to classify and locate different cell types and interstitial components in health and disease
- Develop and manage a website for internal and external communication, analysis, and discovery

**Administrative Core (AC)**
- Provide administrative and meeting support
- Establish working groups
- Solicit patient input and feedback
- Administer an Opportunity Pool to form new partnerships
Recruitment Site Specifics

- Utilizes the UG3/UH3 mechanism—cooperative, milestone-driven, phased award
- Request $200,000 - $300,000 direct costs per year for the UG3 phase (2 years)
- Request $400,000 - $600,000 direct costs per year for the UH3 phase (3 years)
- No guarantee that any given UG3 award will successfully transition to a UH3 award or that the requested budget escalation will occur.
- Each Recruitment Site must initially choose to focus on either AKI or CKD.
- Applications must address both the UG3 and UH3 phases
Applying

• Domestic and foreign institutions may apply
• Institutions may submit multiple applications
• PI must commit a minimum of 2.4 CM (20%)
  – If a multi-PI, combined effort must meet this minimum
• Letter of intent appreciated, not required
• Limited to 12 pages total
• Include a letter from the local IRB indicating willingness to review future common protocol(s) for obtaining research kidney biopsies
• Participant recruitment to begin April 2018
Cooperative Responsibilities

• Resource and data sharing plans
  – Expectation that all resources and data are broadly available in an open access format upon validation
  – Address long-term availability upon completion or termination

• Review Cooperative Agreement Terms and Conditions—become part of the Notice of Award
  – Steering Committee, Project Scientists, Project Officers

• Importance of local patient involvement

• Oversight by an OSMB and an EEP

• Due December 6th, 2016
Senior Scientific Advisor for KPMP

The NIDDK is seeking a Senior Scientific Advisor for the KPMP. This person will oversee working groups, initiate activities, provide advice on current and future precision medicine projects, manage multi-center clinical studies, and administer a portfolio of basic, translational, and clinical research grants that focus on precision medicine and genetics of AKI and CKD, including clinical diabetic nephropathy and glomerular disease.

Please contact Paul Kimmel for more information.
Tissue Interrogation Sites Webinar - September 19th, 3:30pm – 4:30pm EST
The NIDDK Kidney Precision Medicine Project aims to ethically obtain and evaluate human kidney biopsies from participants with AKI or CKD, create a kidney tissue atlas, define disease subgroups, and identify critical cells, pathways, and targets for novel therapies. It will have three distinct, but highly interactive activities.

**Recruitment Sites (RS)**

Kidney Tissue Atlas: Pathology of the Future

Find tissue (cells, and interstitial areas between cells) markers to identify (paint) cells, structures, cell trajectory (healthy, injured, repair, regeneration), activated pathways

Understand heterogeneity between regions, neighboring cells

Even better, use 3D imaging to better see interstitium, glomerulus
The KPMP aims to ethically obtain and evaluate human kidney biopsies from participants with AKI or CKD, create a kidney tissue atlas, define disease subgroups, and identify critical cells, pathways and targets for novel therapies. It is anticipated that the KPMP will be conducted in stages:

**Stage 1 (years 1-2)**
- Optimize and validate tissue processing and interrogation methods
- Establish common clinical protocols and cohort studies enrolling a small number of AKI or CKD participants
- Assess quality of phenotype data and biopsy protocols at each site
- Begin work on kidney tissue atlas. Optimize next generation assays

**Stage 2 (years 3-5)**
- Small scale proof of concept studies to determine if clinical and analytic pipelines are robust
- Implement next generation tissue interrogation assays
- Enrich the kidney tissue atlas.
- Expand longitudinal cohort studies in initial AKI or CKD populations

**Stage 3 (years 6+)**
- Expand to larger cohort studies
- Expected to occur in the next 5 year funding cycle of the KPMP
